

# Advanced User Security Mapping

## Advanced Security Integration for Oracle WebCenter Content with LDAP, Active Directory, & Single Sign-On

Do you have trouble managing security for **multiple Content Server instances that have differing security requirements**, using the same LDAP directory or Active Directory?

Would you like to **easily validate the access users have to content without logging in as each individual user** and checking their user profile information?

Would you like to **automatically assign aliases based on rules you have set up, deny access to content based on user information, or automatically populate users** in WebCenter Content from LDAP or AD?

### Advanced User Security Mapping Can Ease Your Pain!

Advanced User Security Mapping (AUSM) bridges the gap between WebCenter Content security and your enterprise security model. It is the only out-of-box, supported solution to integrate WebCenter Content with third-party single-sign-on products. It also extends the core WebCenter LDAP/AD integration to interpret additional directory information including user attributes, organizational units, and group membership to define access.

### Benefits of Advanced User Security Mapping

**Synchronization** - Automatically populates Oracle WebCenter Content with users, instead of waiting for each user to manually log-in before adding them to workflows, aliases, etc.

**Performance** - Drastically improves network performance through a simplified LDAP or AD structure, or the ability to use single sign-on without connecting to LDAP.

**Flexibility** - AUSM's rules engine extends LDAP/AD integration, allowing administrators to assign user permission for complex rules based on directory information. Users can be assigned to aliases for workflows and access control lists based on directory data.

**Compliance** - Easily enforce and demonstrate user access levels to content across your entire Oracle WebCenter system.

"When we used the basic integration on our network of about 15,000 users, we had around 65,000 LDAP groups. By mapping user attributes from LDAP to [WebCenter Content], we were able to get our [WebCenter] Security Groups to about 12! Besides a much simpler account structure, our network performance has improved dramatically."
