

eParameter Updater™

Automatically map attributes in Pro/INTRALINK®

When your systems contain product data that is valid and accurate, your users can access it more easily in order to do their jobs. Your entire business runs more smoothly because the systems downstream from product design, like the manufacturing and enterprise resource planning systems, have accurate information. Quality data allows you to automate processes, improve user productivity and your return on investment in your enterprise systems.

eParameter allows users to easily map, import, and assign secondary database information, such as ERP/MRP data, as Pro/INTRALINK attributes right within a Workspace. It's never been easier to assign this valuable information!

eParameter Updater can be implemented several different ways:

- Standalone for single or multiple users
 - Update metadata on a daily basis with just a couple mouse clicks
- Batch mode
 - Update metadata in conjunction with batch processes
- Combination Batch and Standalone

Benefits of eParameter Updater

- Search Better, Find Faster, Reuse More
- Better ROI through improved CAD data quality
- Eliminate non value-add tasks like data clean up or manual updating
- Future automation opportunities, like ECOs
