

Filter Option List™ for Oracle UCM

Business Problem

Are your option lists too long for users to navigate?

Would it simplify users' experience if your company's Oracle fields allowed users to type in letters and have the list filter down to an item based on an expanding list of letters or characters?

Leveraging metadata for search and navigation is critical to unleashing the power of the content stored in Content Server.

Accurate and consistent metadata makes the system more powerful and useful, delivering better access to content because it can be more easily found and retrieved.

The best way to ensure consistent metadata is through standardized metadata fields. Oracle Content Server provides a simple way for users to complete metadata fields on a check-in, search, or update screen through the use of option lists.

However, in many instances, metadata fields that contain option lists can become very lengthy. For instance, a field like Customer Name or Product Name can result in an option list that has tens or hundreds of values, forcing users to scroll through a long list to get to the item they wish to select - resulting in user frustration.

Business Solution

Fishbowl Solutions® Filter Option List™ enhances the Oracle® out-of-the-box option list capabilities by allowing users to begin keying in an entry in a field from an option list. Filter Option List then automatically filters down to the items that begin with the letter or letters supplied by the user. Filter Option List speeds the process of completing forms in Oracle and simplifies the Oracle interface. Filter Option List can be configured to automatically “jump” to the filtered items in the list, or display only the filtered items, based on the items being keyed by the user.

Benefits

- Simplifies option list functionality, especially important for long, scrolling metadata option lists.
- Allows a user to begin manually keying in letters for a field, and then jump to items versus scrolling through the entire list to find the desired entry.

Features

- Out-of-box component that enhances the functionality of Oracle Content Server without modifying the core.
- No concerns about upgrading Content Server if you buy the maintenance contract.
- Automatically displays the letters as you type and jumps to the first item in the list that starts with those letters.
