

Subscription Notifier

Custom Content Email Notifications Based on Your Rules

Would you like to automatically email selected users when content is ready to expire or needs review?

Do you want different notification schedules for "notification of expiration" or the ability to notify users based on doc type?

Would you like to go beyond standard email notifications and automate an action, such as updating metadata or triggering a workflow?

With Subscription Notifier, you can!

Proactive Notifications within Oracle WebCenter Content

Subscription Notifier creates subscriptions for tracking and managing business content. Creating subscriptions is easily done through a simple interface that is designed for super users allowing the creation of

advanced queries without iDoc scripting. The system automatically sends email notifications when content is in need of review and allows for custom instructions on what users should do with the content. Subscription Notifier greatly enhances the Oracle out-of-the-box "notification of expiration" functionality. For example, notify groups about a contract renewal, at different intervals such as 90, 60, and 30 days prior to expiration, so they can start renewal negotiations. You can also automatically generate content lists and email them to the appropriate users based on a set of business rules such as notifying the sales team of new brochures or case studies checked in the previous week.

Automate Metadata Updates & Initiate Workflow

Subscription Notifier includes side-effects that let you automatically update metadata, initiate a workflow, or update an external database based on a query. These capabilities are often used by customers as

light-weight retention management to send documents approaching expiration into workflow when they can be updated or archived. These events are extendable and have been used to create new revisions of content items or undo the check-out of a content item that has been out for an extensive amount of time.

"Creatively used, Subscription Notifier will revolutionize the way we manage content in [WebCenter Content]."
